1. Introduction

The Eclipse Foundation is a not-for-profit corporation formed to advance the creation, evolution, promotion, and support of the Eclipse Platform and to cultivate both an open source community and an ecosystem of complementary products, capabilities, and services. Eclipse is an open source community whose projects are focused on providing an extensible development platform and application frameworks for building software.

☞ www.eclipse.org

The Eclipse Open Healthcare Framework (EOHF) is a project within Eclipse formed for the purpose of expediting healthcare informatics technology. The project is composed of extensible frameworks and tools which emphasize the use of existing and emerging standards in order to encourage interoperable open source infrastructure, thereby lowering integration barriers.

☞ www.eclipse.org/ohf

The Integrating the Healthcare Enterprise (IHE) is an initiative by healthcare professionals and industry to improve the way computer systems in healthcare share information. IHE promotes the coordinated use of established standards such as DICOM and HL7 to address specific clinical needs in support of optimal patient care. Systems developed in accordance with IHE communicate with one another better, are easier to implement, and enable care providers to use information more effectively.

☞ www.ihe.net

The IHE Technical Frameworks are a resource for users, developers and implementers of healthcare imaging and information systems. They define specific implementations of established standards to achieve effective systems integration, facilitate appropriate sharing of medical information and support optimal patient care. They are expanded annually, after a period of public review, and maintained regularly by the IHE Technical Committees through the identification and correction of errata.

☞ http://www.ihe.net/Technical_Framework/index.cfm

This documentation addresses the alpha release of the Eclipse OHF plugin implementation of the IHE ITI Technical Framework actor Patient Identifier Cross-reference Consumer for the implementation of the ITI-9 PIX Query Transaction.

2. Getting Started

2.1 Platform Requirements

Verify that the following platform requirements are installed on your workstation, and if not follow the links provided to download and install.

Eclipse SDK 3.2 <http://www.eclipse.org/downloads/>

Java JDK 5.0 <http://java.sun.com/javase/downloads/index.jsp>

2.2 Source Files

Information on how to access the Eclipse CVS technology repository is found on the eclipse wiki:

http://wiki.eclipse.org/index.php/CVS_Howto

Download from dev.eclipse.org/technology/org.eclipse.ohf/plugins:

- org.eclipse.ohf.ihe.common.hl7v2.client
- org.eclipse.ohf.ihe.pix.consumer

For details regarding plugin contents, see the README.txt located in the resources/doc folder of each plugin.

2.3 Dependencies

The Patient Identifier Cross-reference Consumer has dependencies on both other OHF plugins and external sources.

2.3.1 Other OHF Plugins

Patient Identifier Cross-reference Consumer plugins are dependent on additional org.eclipse.ohf project plugins. You also need to check-out the following:

- | | |
|--|---|
| • org.eclipse.ohf.hl7v2.core
org.eclipse.ohf.utilities
org.apache.axis
org.xmlpull.v1 | HL7v2 message object plugins and dependencies |
| • org.eclipse.ohf.ihe.common.mlpp | Minimum Lower Level Protocol |
| • org.eclipse.ohf.ihe.atna.audit | Auditing for messages sent and responses received |
| • org.eclipse.ohf.ihe.common.hl7v2 | HL7v2 segment and field definitions (temporary) |
| • org.apache.log4j | Debug, warning, and error logging |

2.3.2 External Sources

The HL7v2 plugins currently requires a licensed copy of the HL7 access database for the purpose of message object creation and verification. The .mdb file must be placed in the client plugin resources folder under the conf folder.

org.eclipse.ohf.ihe.common.hl7v2.client > resources > conf > hl7_58.mdb

If you have not yet obtained a copy, refer to <http://www.hl7.org>.

2.4 Resources

The following resources are recommended.

2.4.1 IHE ITI Technical Framework

Nine IHE IT Infrastructure Integration Profiles are specified as Final Text in the Version 2.0 ITI Technical Framework: Cross-Enterprise Document Sharing (XDS), Patient Identifier Cross-Referencing (PIX), Patient Demographics Query (PDQ), Audit trail and Node Authentication (ATNA), Consistent Time (CT), Enterprise User Authentication (EUA), Retrieve Information for Display (RID), Patient Synchronized Applications (PSA), and Personnel White Pages (PWP).

The IHE ITI Technical Framework can be found on the following website:

http://www.ihe.net/Technical_Framework/index.cfm#IT.

2.4.2 HL7 Standard 2.5

The Patient Identifier Cross-reference Consumer references standards HL7 version 2.5.

<http://www.hl7.org>.

2.4.3 Newsgroup

Any unanswered technical questions may be posted to Eclipse OHF newsgroup. The newsgroup is located at <news://news.eclipse.org/eclipse.technology.ohf>.

You can request a password at: <http://www.eclipse.org/newsgroups/main.html>.

3. API Documentation

The Patient Identifier Cross-reference Consumer client supports three formats for input. The client will accept:

- a raw HL7 message
- an HL7v2 message object
- a PIX Query message object supporting the manual HL7v2 message construction of:

QBP^Q23 – Get Corresponding Identifiers

Examples for the three types of inputs are found in the org.eclipse.ohf.ihe.pix.consumer plugin.

org.eclipse.ohf.ihe.pix.consumer > src_tests > org.eclipse.ohf.ihe.pix.consumer.tests > HL7PixQuery.java
org.eclipse.ohf.ihe.pix.consumer > src_tests > org.eclipse.ohf.ihe.pix.consumer.tests > MSGPixQuery.java
org.eclipse.ohf.ihe.pix.consumer > src_tests > org.eclipse.ohf.ihe.pix.consumer.tests > OtherPixQuery.java

3.1 Creating a Patient Identifier Cross-reference Consumer Object

3.1.1 Flow of Execution

The steps necessary to create a Patient Identifier Cross-reference Consumer object:

1. Construct ITI-9 PIX Query

```
try {
    pixQuery = new PixConsumer();
} catch (ClientException e) {
    throw new PixConsumerException(e);
}
```

2. Construct MLLP (minimum lower level protocol) Destination

```
mllp = new MLLPDestination(host, port, beginChars, endChars, buffer_size);
```

3. Associate MLLP to ITI-9 PIX Query

```
pixQuery.setMLLPDestination(mllp);
```

3.1.2 API Details

Constructor Summary

[PixConsumer\(\)](#)

Constructs a PIX Consumer Client object.

Method Summary

java.lang.String	getAuditUser() Get the message audit user.
int	getMaxVerifyEvent() Maximum error the message verification allows before submission is blocked.
org.eclipse.ohf.hl7v2.core.message.MessageManager	getMessageManager()
org.eclipse.ohf.ihe.common.mllp.MLLPDestination	getMLLPDestination() Returns the MLLP destination with TCP settings.
boolean	isDoAudit() Returns the doAudit boolean flag.
void	setAuditUser(java.lang.String audituser) Set the user to associate with the message.
void	setDoAudit(boolean doAudit) Set the doAudit boolean flag.
void	setMaxVerifyEvent(int maxVerifyEvent) Maximum error the message verification allows before submission is blocked.
void	setMessageManager(MessageManager globalFactory)
void	setMLLPDestination(org.eclipse.ohf.ihe.common.mllp.MLLPDestination MLLP) Set the MLLP destination with TCP settings.

3.2 Creating a ITI-9 PIX Query Message Object

In the case that your source application is neither capable of creating/receiving raw HL7v2 messages nor creating/receiving HL7v2 message objects, you may use this client to create/receive tailored HL7v2 message objects with a friendly interface for setting and reading the field values.

The following HL7 message types are supported:

QBP^Q23 – Get Corresponding Identifiers

3.2.1 Flow of Execution

The steps necessary to create a tailored HL7v2 message object:

1. Create Patient Identifier Cross-reference Consumer Message

```
PixConsumerQuery msg = PixConsumer.createQuery("[patientID]");
```
2. Change default settings

```
msg.changeDefaultCharacterSet("UNICODE");
```
3. Optionally set the search domain restriction

```
msg.addOptionalDomainRestriction("OHF");
```
4. Optionally set the search response limit

```
admit.addOptionalQuantityLimit(10);
```
5. If method does not already exist to modify message, use method .setField(field, value).

The Patient Identifier Cross-reference Consumer supports populating data in MSH, QPD, and RCP segments. Information about the fields, components, and sub-components available in these segments is available in the HL7 Version 2.5 Standard document in Chapter 2 Section 2.15 Message Control Segments (MSH) and Chapter 5 Section 5.5 Query/Response Message Segments (QPD/RCP).

3.2.2 API Details

Method Summary - PixConsumer

PixConsumerQuery	createQuery (java.lang.String patient_id) Constructs a PIX Consumer Query message object.
------------------	---

Method Summary - PixConsumerQuery

void	addOptionalDomainRestriction (java.lang.String oneDomain) The list of domains to restrict the query.
void	addOptionalQuantityLimit (java.lang.String quantityLimit) Limit the search results returned from the query.
void	changeDefaultAssigningAuthorityNamespaceID (java.lang.String namespace) The initiating system's value to identify the query.
void	changeDefaultAssigningAuthroityUniversalID (java.lang.String id) The initiating system's value to identify the query.
void	changeDefaultAssigningAuthroityUniversalIDType (java.lang.String type)

	The initiating system's value to identify the query.
void	changeDefaultCharacterSet (java.lang.String charset) Character set used to construct this message.
void	changeDefaultControlID (java.lang.String control_id) Unique ID used to link the query message to the response message.
void	changeDefaultProcessEnvironment (java.lang.String environment) Environment type from which this message originates.
void	changeDefaultQueryTag (java.lang.String tag) The initiating system's value to identify the query.
void	changeDefaultReceivingApplication (java.lang.String receivingApplication) The unique identifier for the receiving application.
void	changeDefaultReceivingFacility (java.lang.String receivingFacility) The unique identifier for the receiving facility.
void	changeDefaultSendingApplication (java.lang.String sendingApplication) The unique identifier for the sending application.
void	changeDefaultSendingFacility (java.lang.String sendingFacility) The unique identifier for the sending facility.
void	setField (java.lang.String alias, java.lang.String data) Updates message object structure with data.

3.3 Sending the ITI-9 PIX Query Message

3.3.1 Flow of Execution

The steps necessary to send the message:

1. Send message

```
response = pixQuery.sendHL7(msg, verify);
response = pixQuery.sendMsg(msg, verify);
response = pixQuery.sendQuery(msg, verify);
```

3.3.2 API Details

Method Summary

PixConsumerResponse	sendQuery (PixConsumerQuery msg, boolean verify) Process PixConsumerQuery Object message with optional intermediate verification.
java.lang.String	sendHL7 (java.lang.String rawHL7, boolean verify) Processes HL7 messages with optional intermediate verification.
org.eclipse.ofh. hl7v2.core. message.model. Message	sendMsg (org.eclipse.ofh.hl7v2.core.message.model. Message msg, boolean verify) Process Message Object message with optional intermediate verification.

3.4 Reading a ITI-9 PIX Query Response Message

3.4.1 Flow of Execution

The steps necessary to create a tailored HL7v2 message object:

1. Read Response

```
response.getResponseAck(true);  
response.getQueryStatus(true);  
response.getErrorCode();
```

3.4.2 API Details

Method Summary

java.lang.String	getCharacterSet() MSH-18 Character Set
java.lang.String	getControlID() MSA-2 Message Control ID
java.lang.String	getErrorCode(boolean expandString) ERR-3 HL7 Error Code
java.lang.String	getErrorSeverity(boolean expandString) ERR-4 Error Severity
java.lang.String	getPatientIDAssigningAuthority()

	PID-3 Patient ID (internal) - assigningAuthority
java.lang.String	getPatientIDNumber() PID-3 Patient ID (internal) - id_number
java.lang.String	getPatientIDUniversalID() PID-3 Patient ID (internal) - universal ID
java.lang.String	getPatientIDUniversalIDType() PID-3 Patient ID (internal) - universal ID Type
java.lang.String	getProcessEnvironment(boolean expandString) MSH-11 Processing ID
java.lang.String	getQueryName() QPD-1 Query Name
java.lang.String	getQueryStatus(boolean expandString) QAK-2 Query Response Status
java.lang.String	getQueryTag() QPD-2 Query Tag
java.lang.String	getReceivingApplication(java.lang.String receivingApplication) MSH-5 Receiving Application
java.lang.String	getReceivingFacility() MSH-6 Receiving Facility
java.lang.String	getResponseAck(boolean expandString) MSA-1 Acknowledgement Code
java.lang.String	getSendingApplication() MSH-3 Sending Application
java.lang.String	getSendingFacility() MSH-4 Sending Facility

4. Sample Code

For example implementations, see

org.eclipse.ohf.ihe.pix.consumer > src_tests > org.eclipse.ohf.ihe.pix.consumer.tests > HL7PixQuery.java
org.eclipse.ohf.ihe.pix.consumer > src_tests > org.eclipse.ohf.ihe.pix.consumer.tests > MSGPixQuery.java
org.eclipse.ohf.ihe.pix.consumer > src_tests > org.eclipse.ohf.ihe.pix.consumer.tests > OtherPixQuery.java

4.1 Raw HL7

In the happy circumstance that your source application is fully capable of creating/receiving raw HL7v2 messages, you may use this client as a middle-layer to verify, audit, and communicate with the PIX/PDQ server. Server responses are returned to the caller as raw HL7v2 message strings.

For example implementation, see

org.eclipse.ohf.ihe.pix.consumer > src_tests > org.eclipse.ohf.ihe.pix.consumer.tests > HL7PixQuery.java

4.2 HL7v2 Message Object

In the happy circumstance that your source application is capable of creating/receiving HL7v2 message objects, you may use this client as a middle-layer to verify, convert to raw HL7, audit, and communicate with the PIX/PDQ server. Server responses are returned to the caller as HL7v2 message objects.

For example implementation, see

org.eclipse.ohf.ihe.pix.consumer > src_tests > org.eclipse.ohf.ihe.pix.consumer.tests > MSGPixQuery.java

4.3 ITI-9 PIX Query Message Object

In the case that your source application is neither capable of creating/receiving raw HL7v2 messages nor creating/receiving HL7v2 message objects, you may use this client to create/receive tailored HL7v2 message objects with a friendly interface for setting and reading the field values.

ITI-9 PIX Query Message Classes

- PixConsumerQuery

ITI-9 PIX Query Server Response Class

- PixConsumerResponse

For example implementation, see

org.eclipse.ohf.ihe.pix.consumer > src_tests > org.eclipse.ohf.ihe.pix.consumer.tests > OtherPixQuery.java
