

Cloud deployment of M2M applications

OpenHAB, RabbitMQ and Storm use case

February 19, 2014

Eclipse IoT day - Grenoble

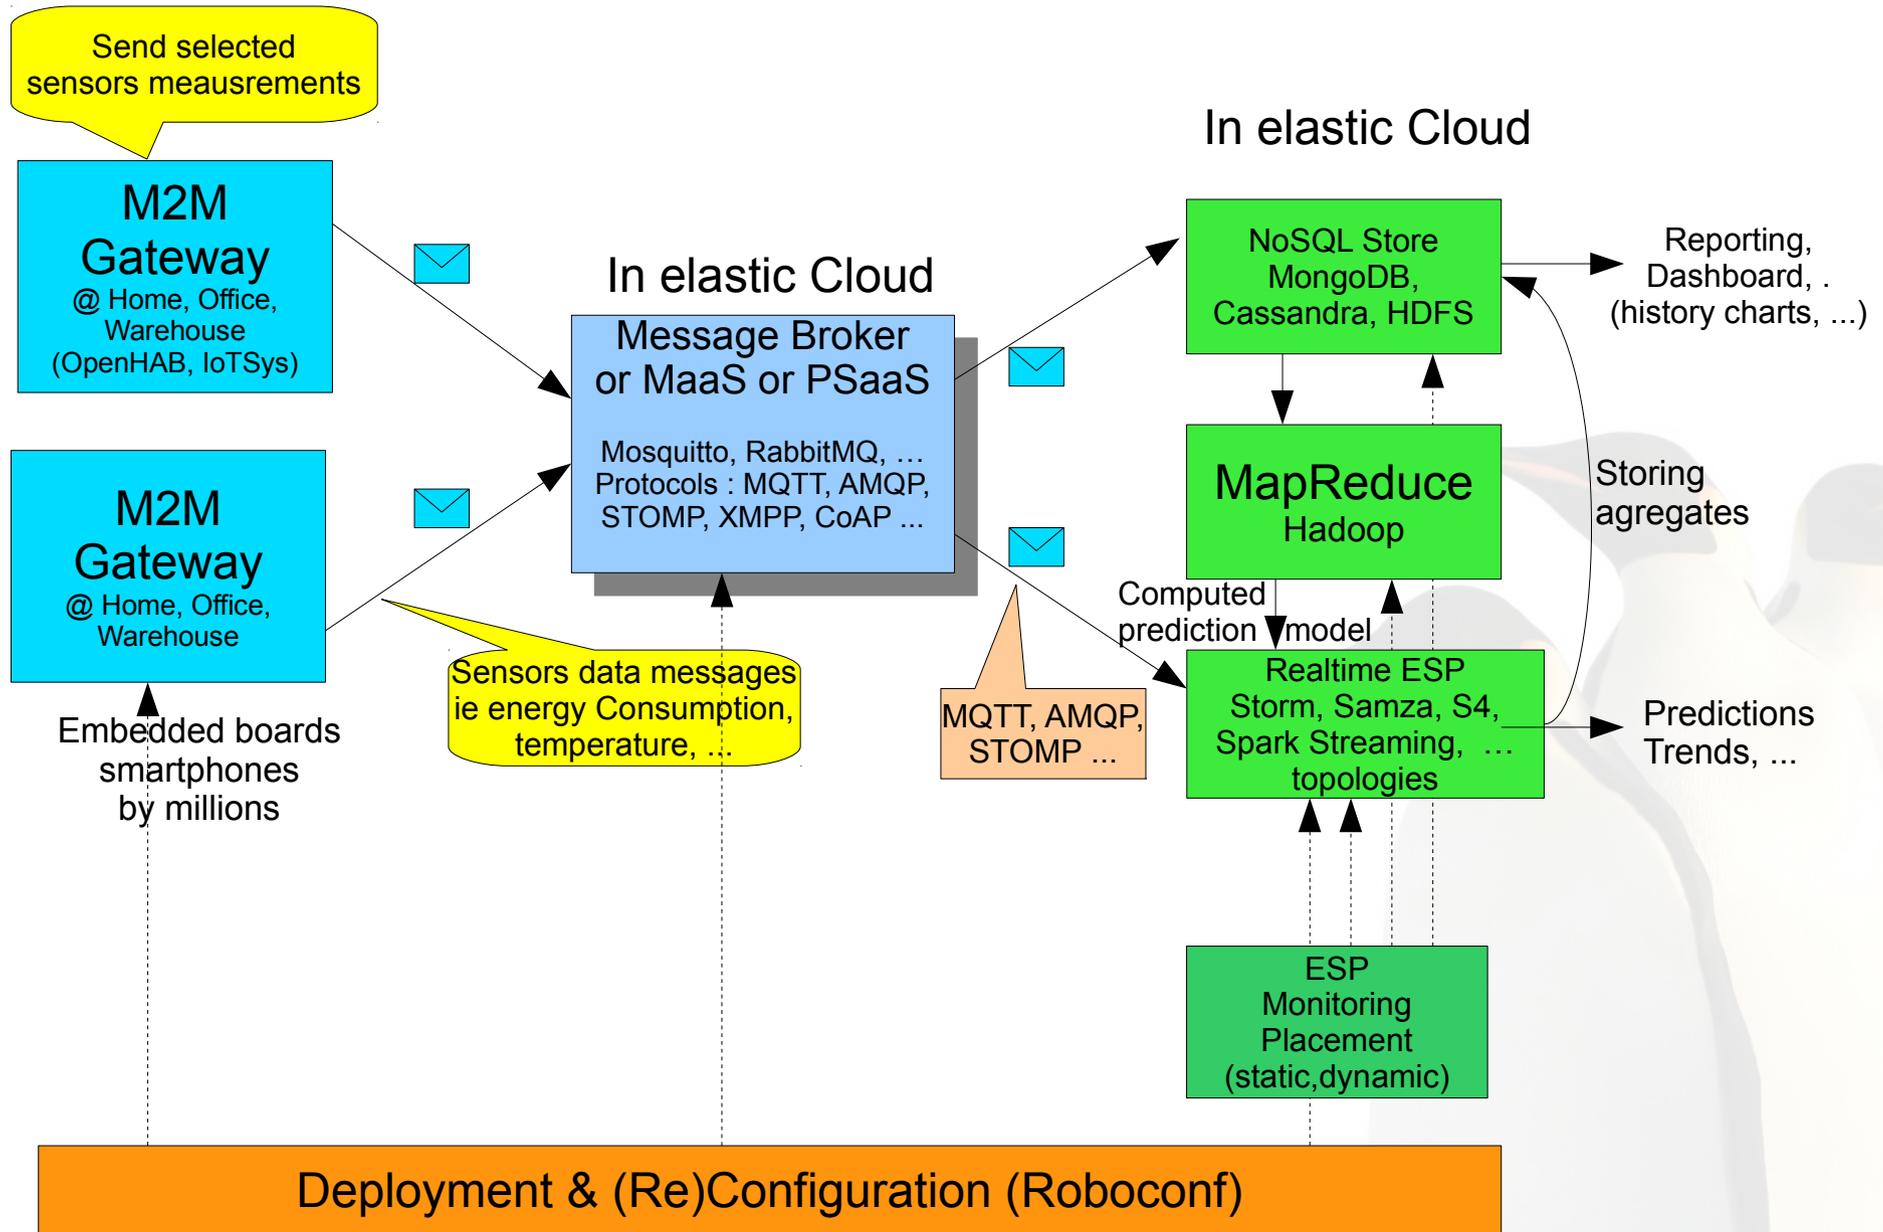

Pierre-Yves Gibello : pygibello@linagora.com

Noël De Palma : noel.de_palma@imag.fr

- M2M "ubilytics" big picture
- Deployment issues
- A processing chain
- Roboconf dynamic (re)configuration
- Demo scenario

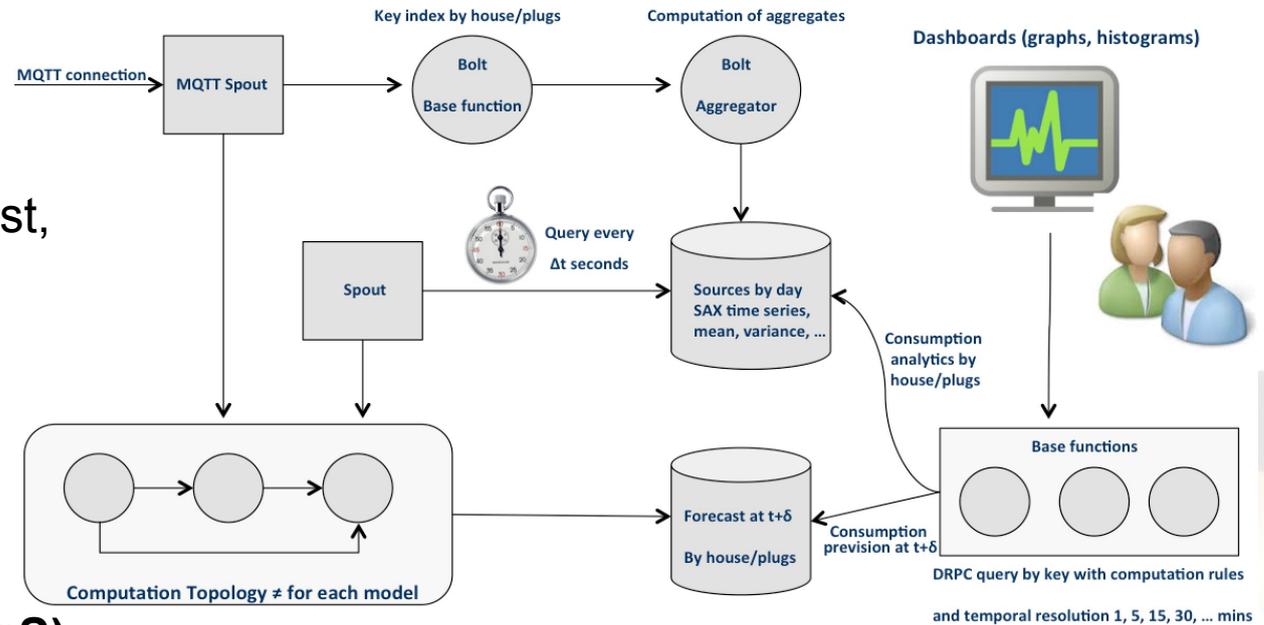

M2M "ubilytics" big picture

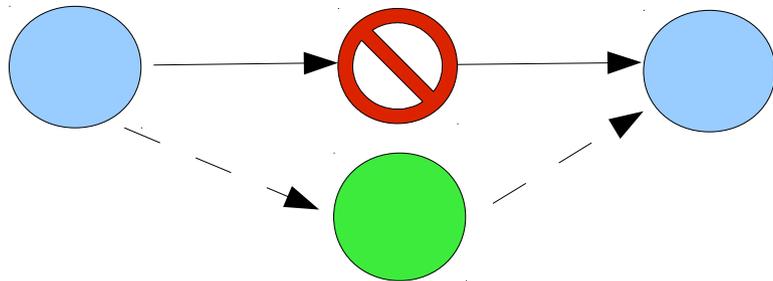

- **Multi-scale**
 - From embedded (box, sensor, card...) to cloud / IaaS
 - More and more devices while IoT emerges
- **Elastic & adaptative**
 - Add/remove components (eg. according to load patterns)
 - Adapt data flow (eg. load balancing)
 - Optimize (eg. co-locate)
- **Dependencies to be resolved at runtime**
 - Location of components (eg. where to send data)
 - Configuration information (eg. database credentials)

Example :
energy consumption forecast,
based on Storm.

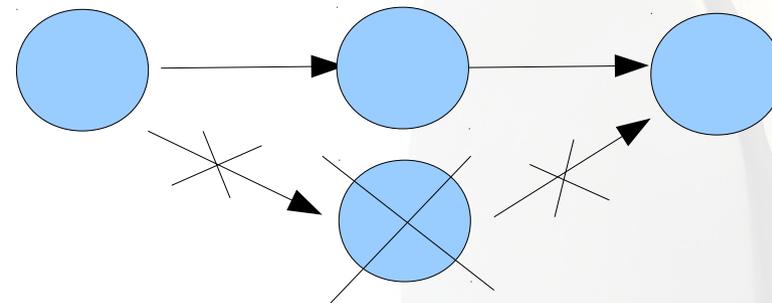

Dynamic elasticity (eg. on IaaS)

Bottleneck detection

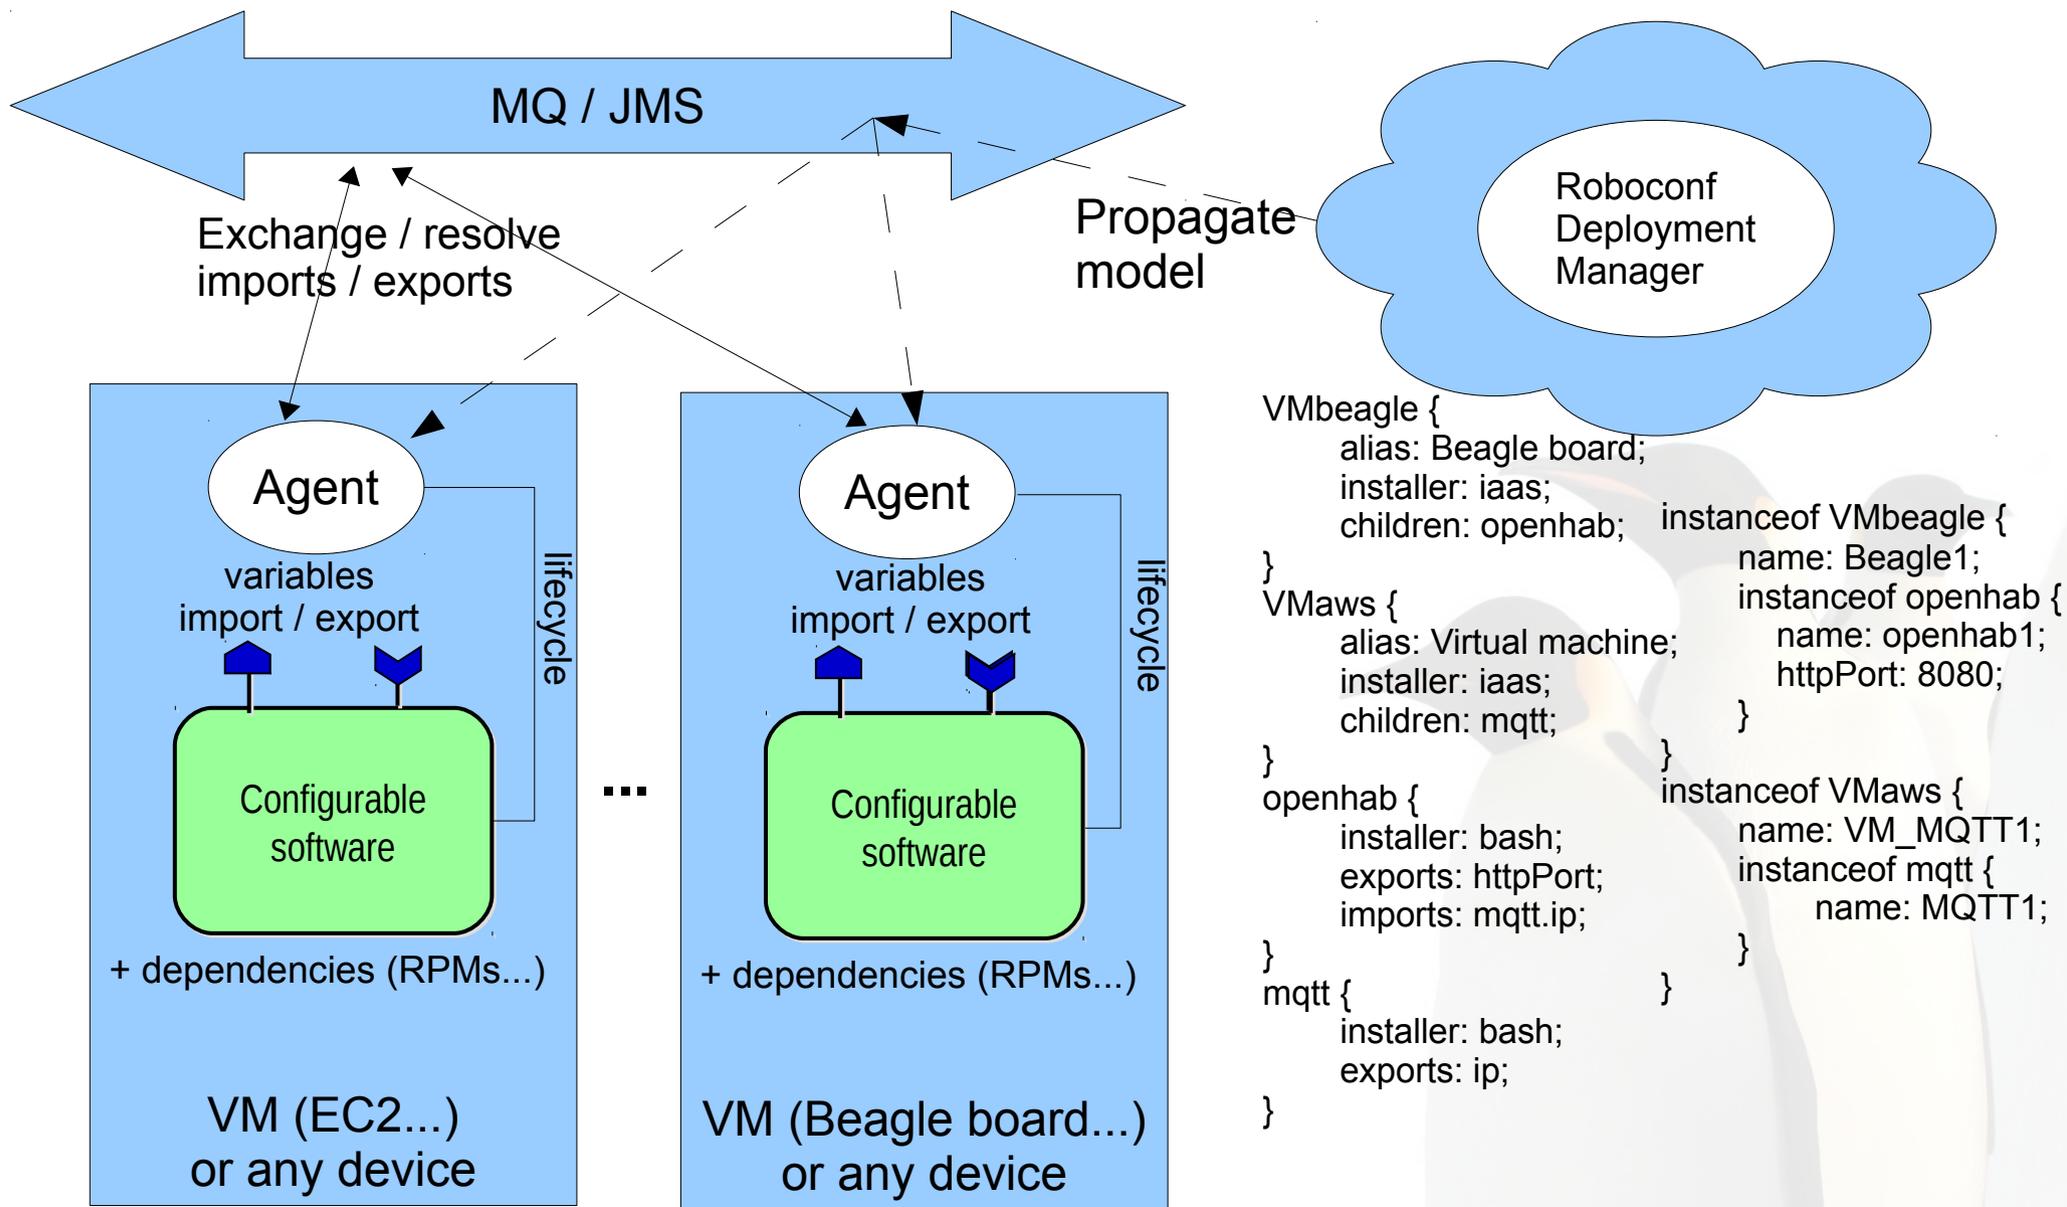

Insert additional node(s) + reconfigure

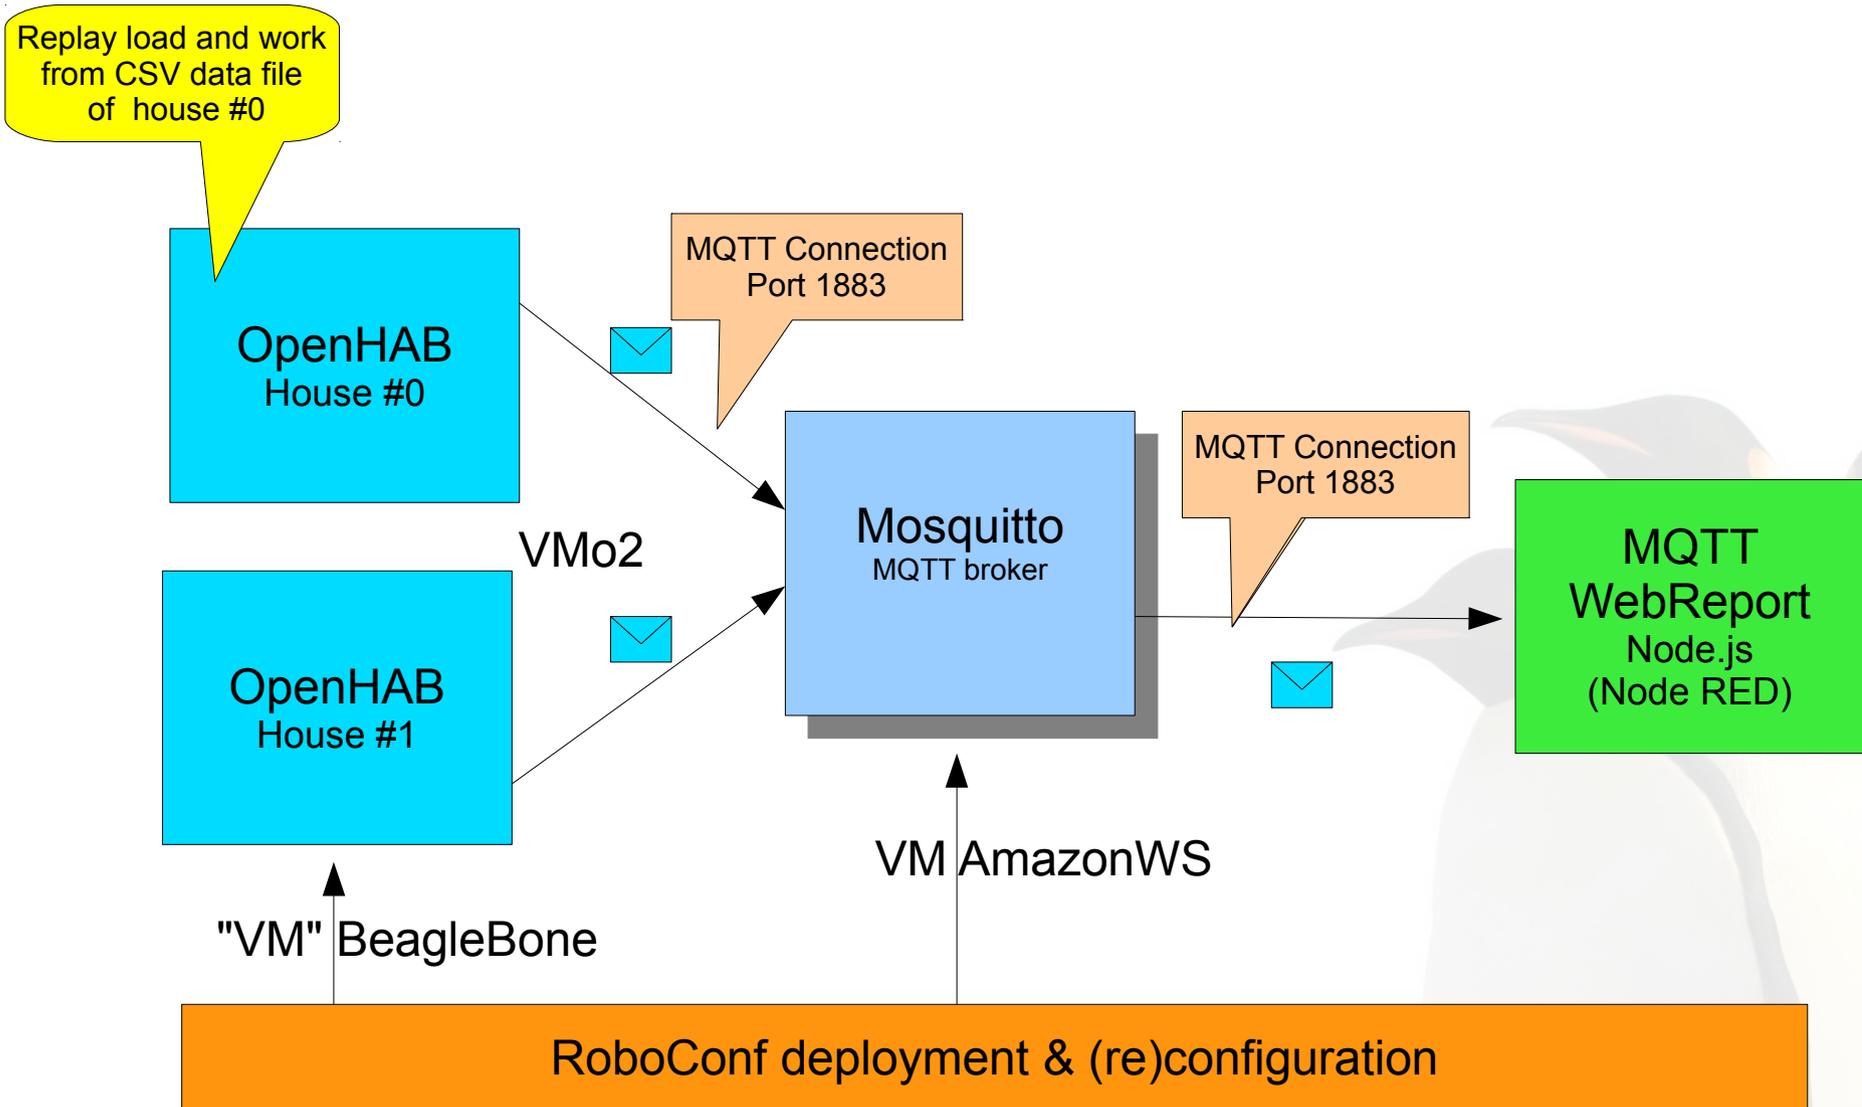

Shrink when possible (lower flow)

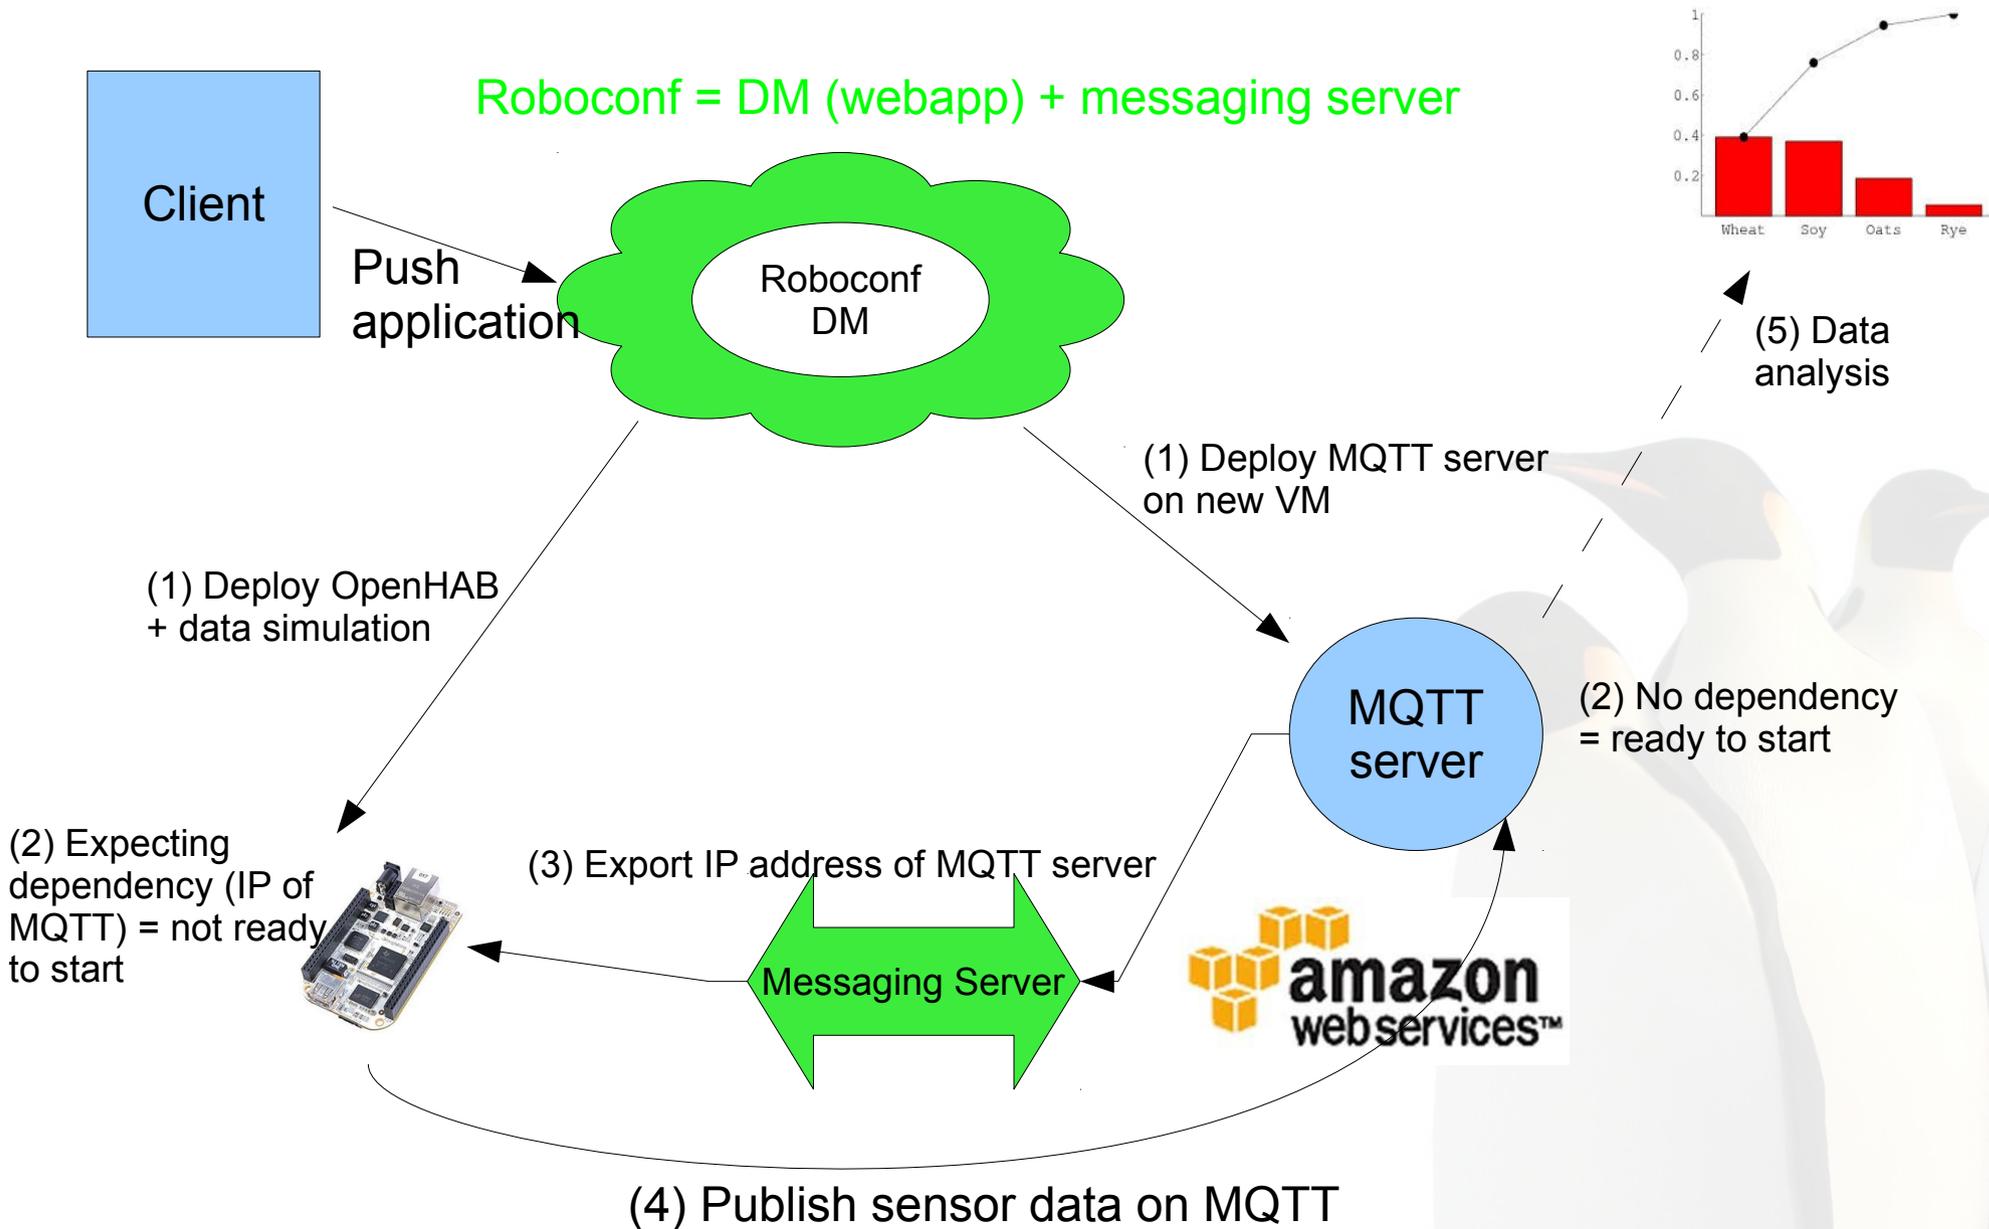

Remove useless node(s) + reconfigure

- **Application model**
 - Graph of components (eg. VMs or software packages) with dependencies (export/import of configuration variables)
 - Initial deployment description (set of instances, deployed on VMs)
- **Deployment manager (DM)**
 - Creates VMs on IaaS when necessary
 - Deploys the model (including software packages) on VMs
- **Agent**
 - Present on each VM
 - Cross-instances communication (exchange of variables import/export)
 - Admin communication with DM
 - Lifecycle of software deployed on the VM (setup, start, stop...) according to dependency resolution
- **Asynchronous communication**
 - Based on RabbitMQ

Roboconf = DM (webapp) + messaging server

Any question ?

LINAGORA

Groupe LINAGORA

80, rue Roque de Fillol
92800 PUTEAUX
