

Customizing the PTP monitoring layout

July 31, 2013 | Carsten Karbach

Monitoring Architecture I

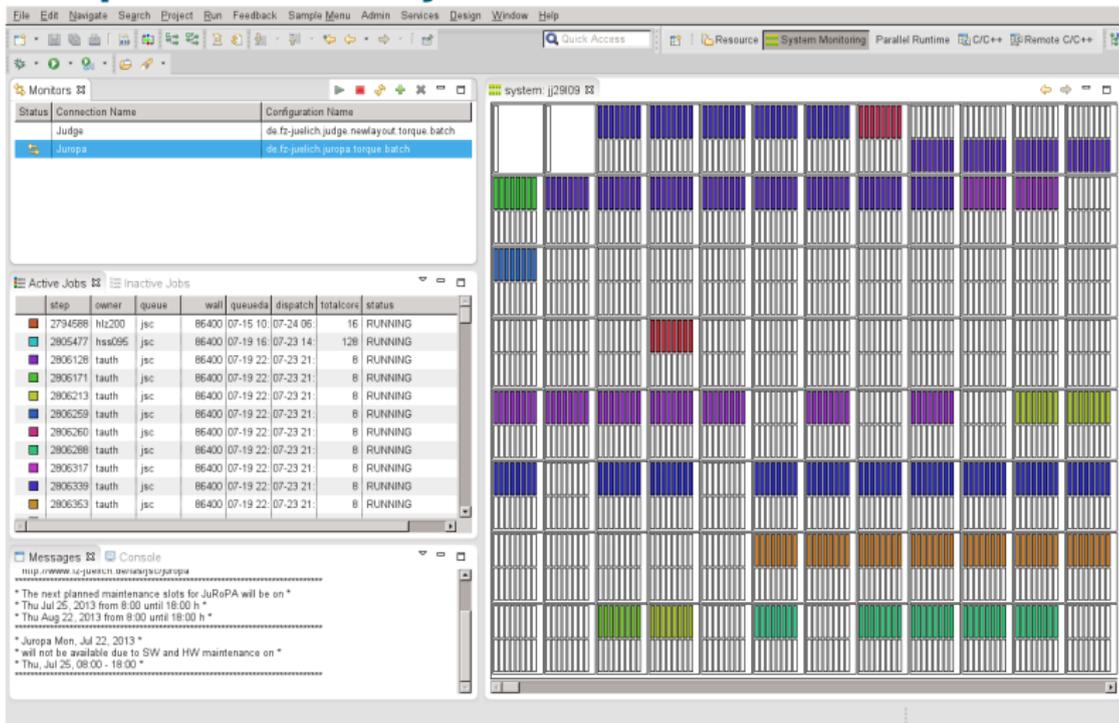

Monitoring Architecture II

- **LML_da** gathers status information, calls target system's remote commands, written in Perl
- **LML** is an XML data format for status information of supercomputers
- LML request: contains table filtering information, visible/hidden columns, machine topology
- LML response: contains the request and status information
- Client stores **current layout** request for successive Eclipse sessions

Objective: Customize the LML-Layout

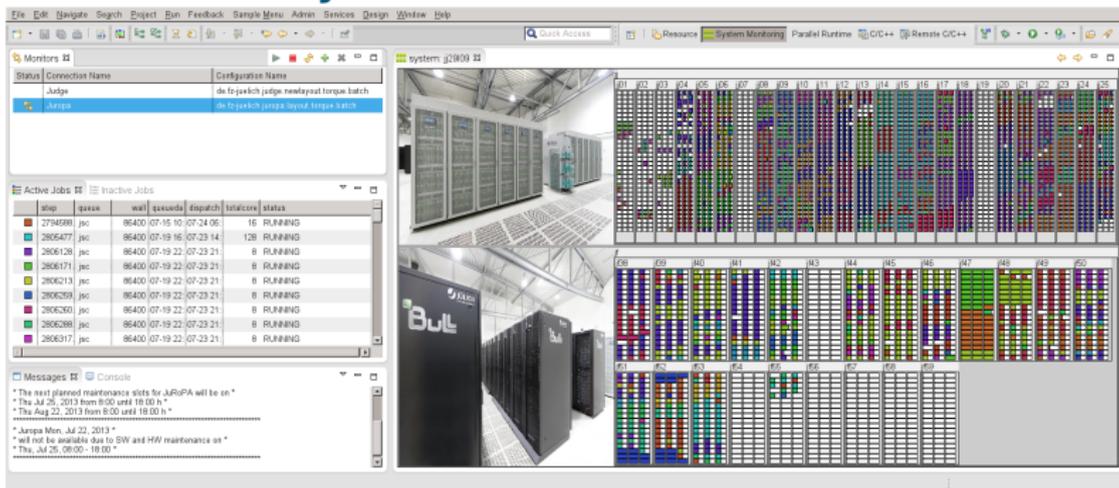

define machine topology, arrangement of nodes, layout of job lists

Example Default Layout JUROPA

Two-level hierarchy of nodes and cores

Customized Layout JUROPA

The screenshot displays the JUROPA monitoring interface. On the left, there is a 'Monitors' panel with a table of connections and a 'Messages' panel with system alerts. The main area is divided into two sections: a central image of server racks and a large grid of job status indicators. The job list table is as follows:

id	queue	wall	seconds	dispatch	initiators	status
2794980	jsc	86400	07-15 10:07-24 06:		16	RUNNING
2805477	jsc	86400	07-19 16:07-23 14:		126	RUNNING
2806128	jsc	86400	07-19 22:07-23 21:		8	RUNNING
2806171	jsc	86400	07-19 22:07-23 21:		8	RUNNING
2806213	jsc	86400	07-19 22:07-23 21:		8	RUNNING
2806259	jsc	86400	07-19 22:07-23 21:		8	RUNNING
2806298	jsc	86400	07-19 22:07-23 21:		8	RUNNING
2806317	jsc	86400	07-19 22:07-23 21:		8	RUNNING

The messages panel contains the following text:

- * The next planned maintenance slots for JUROPA will be on *
- * The Jul 25, 2013 from 8:00 until 18:00 h *
- * The Aug 22, 2013 from 8:00 until 18:00 h *
- * Juropa Mon, Jul 22, 2013 *
- * will not be available due to SW and HW maintenance on *
- * The Jul 25, 08:00 - 18:00 *

- Four-level hierarchy of partitions, racks, nodes and cores
- Images attached to each partition
- Customized background colors
- Disabled columns in job list

Content

- 1 LML-Layout
- 2 Define machine topology
- 3 Setup customized LML-Layout

Part I: LML-Layout

July 31, 2013 | Carsten Karbach

LML-Layout

- LML-Layout configures the layout of the system monitoring perspective
- Examples for customization:
 - Activate/Deactivate table columns
 - Arrangement of nodes
 - Background colors for nodes
 - Map machine topology, e.g. place nodes into racks
 - Attach images to nodes
- Layout-content is
 - **tablelayout** configures job lists
 - **nodedisplaylayout** defines machine topology, customizes layout of nodes view

Layout Structure

```
<rm:layout xmlns:rm="http://eclipse.org/ptp/rm" xmlns="">
<tablelayout id="tl_Run" gid="ActiveJobsView" active="true
  " contenthint="jobs">
  ...
</tablelayout>
<tablelayout id="tl_WAIT" gid="InactiveJobsView" active="
  true" contenthint="jobs">
  ...
</tablelayout>
<nodedisplaylayout id="nodedisplay" gid="nd_1" active="
  true">
  ...
</nodedisplaylayout>
</rm:layout>
```

- One tablelayout for each job list
- layout element will be placed into target system configuration (see 3)

Table Layout

```
<tablelayout id="tl_Run" gid="ActiveJobsView" active="true"
  " contenthint="jobs">
<column key="step" cid="1" pos="0" width="0.1" active="
  true" />
<column key="owner" cid="2" pos="1" width="0.1" active="
  true" />
...
</tablelayout>
```

- *active* attributes configure visibility of columns
- *key* specifies the attribute shown in the column
- *cid* is the column ID
- *pos* is the position of the column within the table
- *width* is percentaged width of the column

Part II: Define machine topology

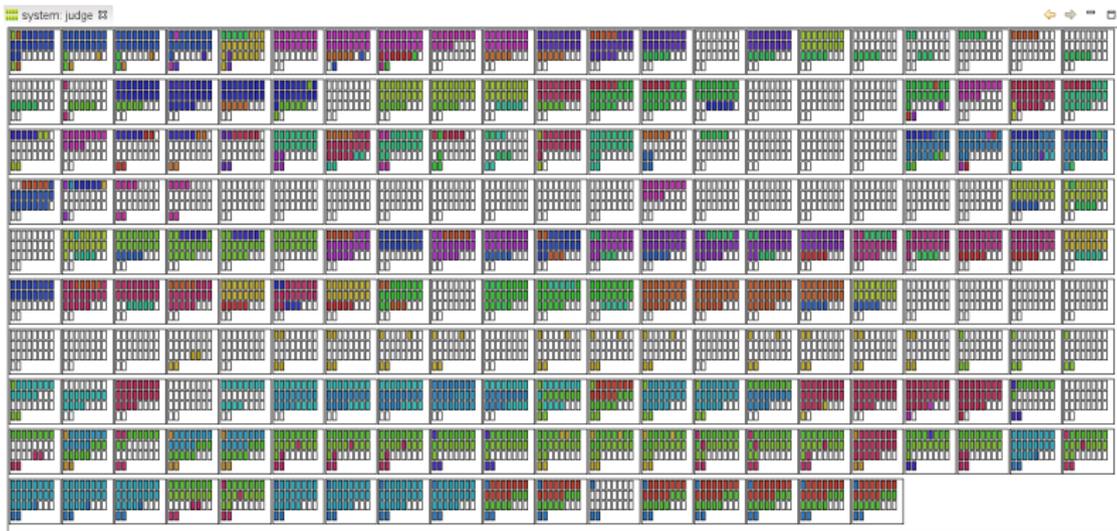

July 31, 2013 | Carsten Karbach

Nodedisplay Layout

```
<nodedisplaylayout id="nodedisplay" gid="nd_1" active="
  true">
<schemehint>
  <el1 tagname="node" min="1" max="206" mask="judge%03d">
    <el2 tagname="core" min="0" max="25" mask="-c%02d" />
  </el1>
</schemehint>
<el0 rows="10" cols="21" maxlevel="2" vgap="5"/>
</nodedisplaylayout>
```

- *schemehint* defines the machine topology, here:
 - Two level hierarchy of nodes and cores
 - 206 nodes, each having 26 cores
 - *mask* attribute is used to map the node ID (1..206) to the actual node names (judge001..judge206)
- *el0* contains layout information for the nodes view, here:
 - The nodes are arranged in a grid of 10 rows and 21 columns
 - *maxlevel=2* defines that one rectangle is painted for each core, *maxlevel=1* would draw one rectangle for each node

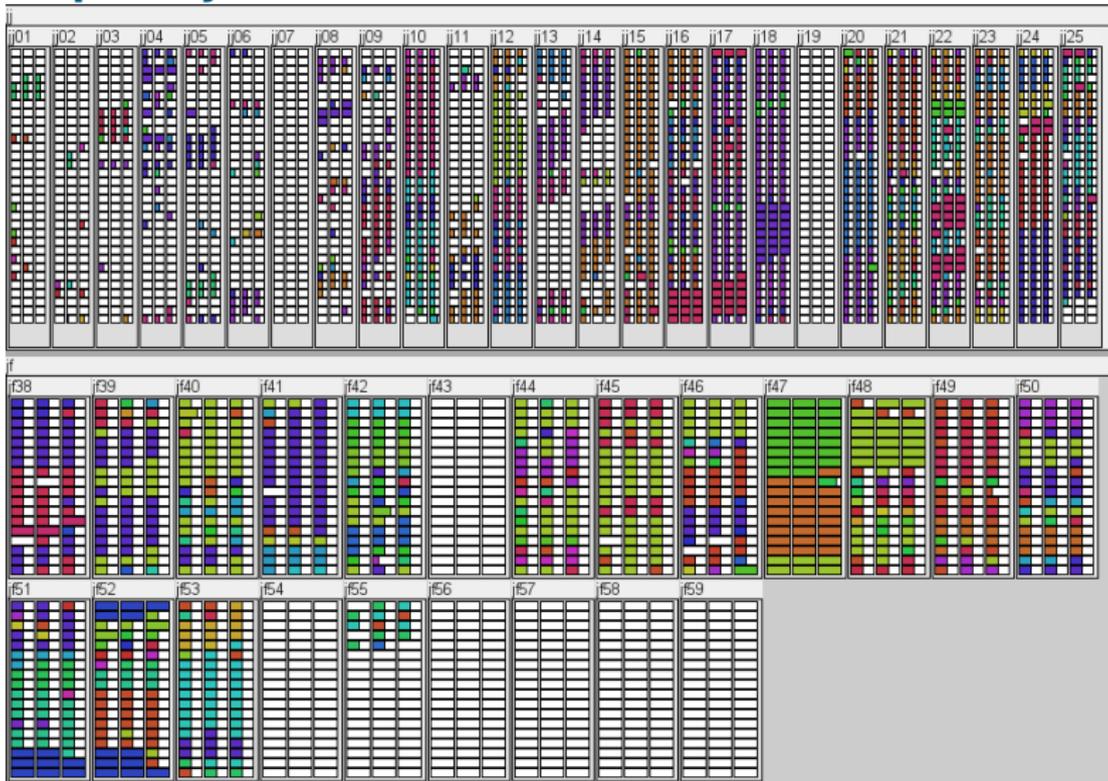

Layout Result

Juropa Nodedisplay Layout

```
<nodedisplaylayout id="nodedisplay" gid="nd_1">
<schemehint>
  <el1 tagname="part" min="0" max="0" map="jj">
    <el2 tagname="rack" min="1" max="25" mask="%02d">
      <el3 tagname="node" min="1" max="96" mask="c%02d">
        <el4 tagname="core" min="0" max="15" mask="-c%02d"/>
      </el3>
    </el2>
  </el1>
  <el1 tagname="part" min="1" max="1" map="jf">
    ...
  </el1>
</schemehint>
<el0 vgap="5" maxlevel="3" cols="1" rows="2" background="#
aaa">
  <el1 min="0" max="0" showtitle="true" rows="1" cols="25"
maxlevel="4">
    
    <el2 min="1" max="25" showtitle="true" rows="32" cols=
"3" maxlevel="4"/>
  </el1>
</el0>
```

Juropa Layout Result

Juropa Layout Explanation

- **Four-Level** hierarchy, 2 parts, the first with 25 racks, each having 96 nodes
- The concatenated masks need to **match** the real node names, *map* is used for names without digits
- JUROPA node names match the scheme `jj%02dc%02d`, e.g. `jj09c18`
- Allowed node names defined by the above *schemehint* are `jj01c01..jj01c96..jj02c01..jj25c96`
- The tree within the *e/0* element *references* the tree provided by the *schemehint*
- *e/0* configures the grid for the partitions
- *e/1* configures the grid for the racks within the first partition, here it defines: each rack should print its name (*showtitle*), the racks are arranged in a 1X25 grid (*rows,cols*)

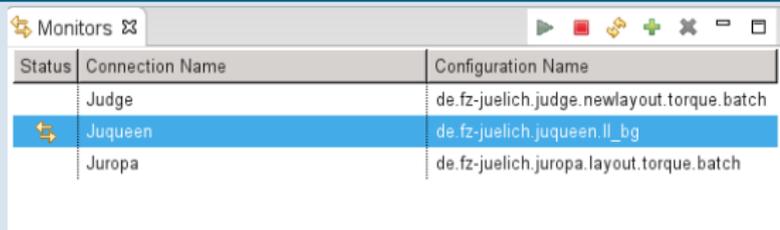

Part III: Setup customized LML-Layout

July 31, 2013 | Carsten Karbach

Simple Setup I

- Not yet included in a build, should come soon
- Track the process at [bug 360435](#)

Step 1: Create a connection to your target system

Status	Connection Name	Configuration Name
	Judge	de.fz-juelich.judge.newlayout.torque.batch
	Juqueen	de.fz-juelich.juqueen.ll_bg
	Juropa	de.fz-juelich.juropa.layout.torque.batch

Step 2: Let LML_da create tmp files on your remote machine

```
karbach@juqueen1:~ $ cd .eclipsesettings/  
karbach@juqueen1:~/.eclipsesettings $ echo "keptmp=1" > .LML_da_options  
karbach@juqueen1:~/.eclipsesettings $ █
```

Simple Setup II

Step 3: Refresh your connection

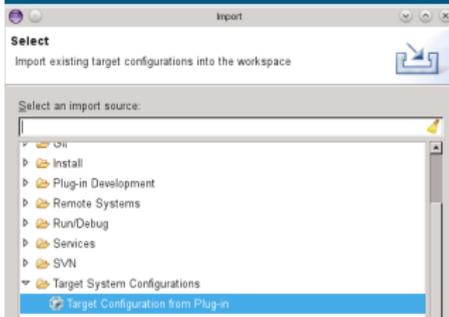

Step 4: Use the layout.xml file as template, copy content

```

karbach@juqueen1:~/eclipsesettings $ cd tmp_juqueen2.zam.kfa-juelich.de_30815/
karbach@juqueen1:~/eclipsesettings/tmp_juqueen2.zam.kfa-juelich.de_30815 $ ll
total 3776
-rw-r--r-- 1 karbach zam 61544 Jul 24 13:25 blocks_LML.xml
-rw-r--r-- 1 karbach zam 1201838 Jul 24 13:25 datastep_addcolor.xml
-rw-r--r-- 1 karbach zam 1183246 Jul 24 13:25 datastep_combineLML.xml
-rw-r--r-- 1 karbach zam 0 Jul 24 13:24 datastep_getdata.xml
-rw-r--r-- 1 karbach zam 1170815 Jul 24 13:25 jobs_LML.xml
-rw-r--r-- 1 karbach zam 6031 Jul 24 13:24 layout.xml
-rw-r--r-- 1 karbach zam 616 Jul 24 13:25 LML_da.errlog
-rw-r--r-- 1 karbach zam 122500 Jul 24 13:25 LML_da.log
-rw-r--r-- 1 karbach zam 21181 Jul 24 13:24 nodes_LML.xml
-rw-r--r-- 1 karbach zam 6839 Jul 24 13:24 request.xml
-rw-r--r-- 1 karbach zam 574 Jul 24 13:24 sysinfo_LML.xml
-rw-r--r-- 1 karbach zam 1708 Jul 24 13:24 workflow.xml
karbach@juqueen1:~/eclipsesettings/tmp_juqueen2.zam.kfa-juelich.de_30815 $ █
  
```

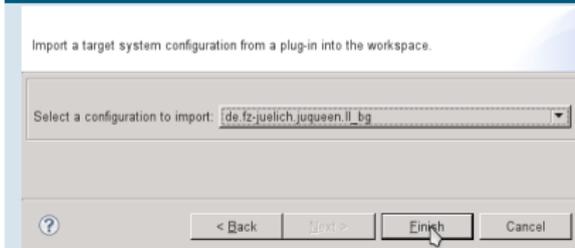

Simple Setup III

Step 5: Create a customized TSC

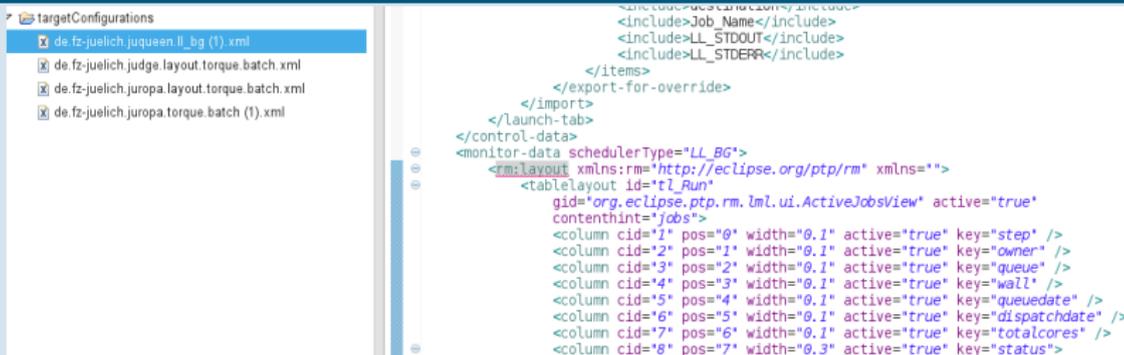

see also [FAQ](#) for this step

Step 6: Import the TSC you want to adjust

Simple Setup IV

Step 7: Place content of layout.xml into TSC and customize it

```

<!-- ***** -->
<include>Job_Name</include>
<include>LL_STDOUT</include>
<include>LL_STDEPR</include>
</items>
</export-for-override>
</import>
</launch-tab>
</control-data>
<monitor-data schedulerType="LL_BG">
  <tm:layout xmlns:rm="http://eclipse.org/ptp/rm" xmlns="">
    <tablelayout id="tl_Run"
      gid="org.eclipse.ptp.rm.lml.ui.ActiveJobsView" active="true"
      contenthint="jobs">
      <column cid="1" pos="0" width="0.1" active="true" key="step" />
      <column cid="2" pos="1" width="0.1" active="true" key="owner" />
      <column cid="3" pos="2" width="0.1" active="true" key="queue" />
      <column cid="4" pos="3" width="0.1" active="true" key="wall" />
      <column cid="5" pos="4" width="0.1" active="true" key="queuedate" />
      <column cid="6" pos="5" width="0.1" active="true" key="dispatchdate" />
      <column cid="7" pos="6" width="0.1" active="true" key="totalcores" />
      <column cid="8" pos="7" width="0.3" active="true" key="status">

```

Note, how the layout element is declared. Insert it as child of monitor-data.

Step 8: Adjust the name of your TSC

```

<!-- ***** -->
<resource-manager-builder xmlns="http://eclipse.org/ptp/rm"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://eclipse.org/ptp/rm http://eclipse.org/ptp/schemas/v1.1/rm.xsd"
  name="de.fz.juelich.juqueen.layout|ll_bg">
  <control-data>

```

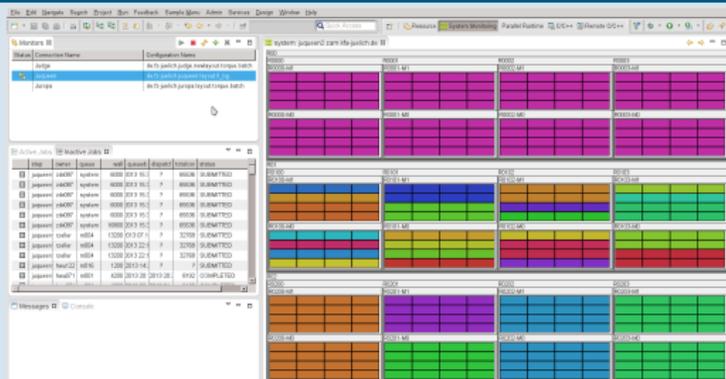

Simple Setup V

Step 9: Remove the old connection

Status	Connection Name	Configuration Name
	Judge	de.fz-juelich.judge.newlayout.torque.batch
	Juqueen	de.fz-juelich.juqueen.ll_bg

Step 10: Create a new connection with your new TSC/LML-Layout

The screenshot shows a software interface with a grid of colored cells representing a layout. The grid is divided into several sections, each with a different color scheme (purple, blue, green, red, orange). A sidebar on the left shows a list of connections and their status.

id	name	status	url	created	updated	deleted	status

99	juqueen	active	system	6000	2013-01-07	7	80008	SUBMITTED
100	juqueen	active	system	6000	2013-01-07	7	80008	SUBMITTED

Simple Setup – Remarks

- After each change of the LML-Layout you need to **repeat step 9-10** to activate the changes
- The customized LML-Layout is only sent on the **first connect**
- The XML schema for the LML-Layout is documented [here](#)
- If your changes are not updated, check if your custom LML-Layout is **valid**
- You can easily **publish** your customized TSC, so that all users of your remote machine can benefit from your layout
- The adjusted TSC could even be added as default TSC to the list of standard TSCs

Alternative Setup I

- Already working with latest PTP Kepler build
- Will not work as soon as *Simple Setup* is implemented
- Step 1-4 are identical with the simple setup

Step 5: Copy layout.xml into samples directory

```
karbach@juqueen1:~/.eclipsesettings $ cd tmp_juqueen2.zam.kfa-juelich.de_21451/  
karbach@juqueen1:~/.eclipsesettings/tmp_juqueen2.zam.kfa-juelich.de_21451 $ cp layout.xml ../samples/layout_default_LL_BG.xml  
karbach@juqueen1:~/.eclipsesettings/tmp_juqueen2.zam.kfa-juelich.de_21451 $
```

Name the file in the samples directory `layout_default_RMS.xml`, where RMS has to be replaced with the remote system name abbreviation. You can find this abbreviation in the `report.log` file within the `tmp` directory or in the corresponding TSC in the `monitor-data` element stored in the `schedulerType` attribute (e.g. TORQUE, LL_BG, GridEngine, COBALT_BG, SLURM_ALPS, SLURM)

Step 6: Adjust the layout file `layout_default_RMS.xml`

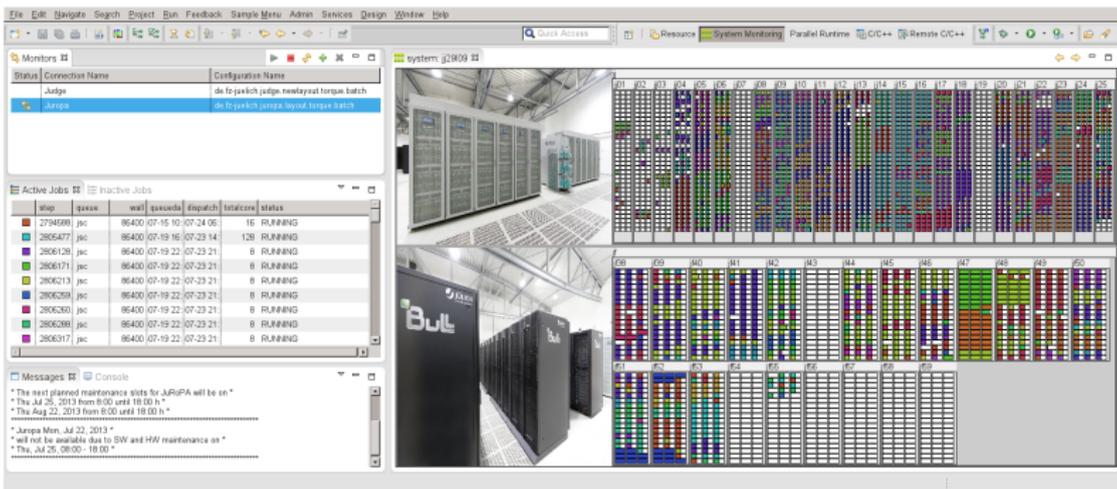

Alternative Setup II

- Run steps 9-10 of the simple setup

Remarks

- This setup is estimated as harder, because you need to detect the RMS abbreviation and you have to change files directly on your remote system
- Disadvantages of this setup:
 - If there is a new version of LML_da, it is automatically copied to your remote machine and might overwrite your custom layout
 - There is no automatic validation of your custom LML-Layout
 - You can only have one LML-Layout per remote machine, while with the *simple setup* you can have multiple

Questions?

The screenshot displays the Jülich System Monitoring interface. The top navigation bar includes menus for File, Edit, Navigate, Search, Project, Run, Feedback, Sample Menu, Admin, Services, Design, Window, and Help. The main interface is divided into several panels:

- Monitors:** A table showing connection names and configuration names.

Status	Connection Name	Configuration Name
	Judge	de-to-juelich-judge-meslaynat-torque-batch
	Juripa	de-to-juelich-juripa-ippool-torque-batch
- Active Jobs:** A table listing active jobs with columns for snp, queue, wall, queueids, dispatch, totproc, and status.

snp	queue	wall	queueids	dispatch	totproc	status
2784588	jsc	86400	07-19 10-07-24 06		16	RUNNING
2805477	jsc	86400	07-19 16-07-23 14		128	RUNNING
2806128	jsc	86400	07-19 22-07-23 21		8	RUNNING
2806211	jsc	86400	07-19 22-07-23 21		8	RUNNING
2806258	jsc	86400	07-19 22-07-23 21		8	RUNNING
2806260	jsc	86400	07-19 22-07-23 21		8	RUNNING
2806288	jsc	86400	07-19 22-07-23 21		8	RUNNING
2806317	jsc	86400	07-19 22-07-23 21		8	RUNNING
- Messages:** A console window showing maintenance notices:
 - * The next planned maintenance slots for JRGPA will be on *
 - * Thu Jul 25, 2013 from 8:00 until 18:00 h *
 - * Thu Aug 22, 2013 from 8:00 until 18:00 h *
 -
 - * Juripa Mon, Jul 22, 2013 *
 - * will not be available due to SW and HW maintenance on *
 - * Thu, Jul 25, 08:00 - 18:00 *
 -
- Resource Grid:** A large grid showing resource usage across various nodes (e.g., 001-026, 028-050, 052-074, 076-098, 100-122, 124-146, 148-170, 172-194, 196-218, 220-242, 244-266). The grid is color-coded to represent different resource states.
- Server Room Images:** Two photographs showing the physical server racks in the Jülich data center, with the Bull logo visible on the equipment.
